## Chordify

Advanced Functional Programming for Fun and Profit

### Introduction

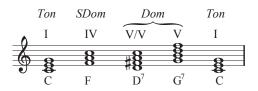

- ► Modelling musical harmony using Haskell
- ► Applications of a model of harmony:
  - Musical analysis
  - Finding cover songs
  - Generating chords for melodies
  - Correcting errors in chord extraction from audio sources
- ► Chordify—a web-based music player with chord recognition

## What is harmony?

- ▶ Harmony arises when at least two notes sound at the same time
- Harmony induces tension and release patterns, that can be described by music theory and music cognition
- ► The internal structure of the chord has a large influence on the consonance or dissonance of a chord
- ▶ The surrounding context also has a large influence

# What is harmony?

- ▶ Harmony arises when at least two notes sound at the same time
- Harmony induces tension and release patterns, that can be described by music theory and music cognition
- ► The internal structure of the chord has a large influence on the consonance or dissonance of a chord
- ▶ The surrounding context also has a large influence

Demo: how harmony affects melody

## Why are harmony models useful?

Having a model for musical harmony allows us to automatically determine the functional meaning of chords in the tonal context. The model determines which chords "fit" on a particular moment in a song.

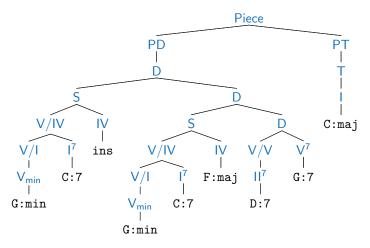

# Why are harmony models useful?

Having a model for musical harmony allows us to automatically determine the functional meaning of chords in the tonal context. The model determines which chords "fit" on a particular moment in a song. This is useful for:

- ► Musical information retrieval (find songs similar to a given song)
- ► Audio and score recognition (improving recognition by knowing which chords are more likely to appear)
- Music generation (create sequences of chords that conform to the model)

# Application: harmony analysis

Parsing the sequence  $G_{min}$   $C^7$   $G_{min}$   $C^7$   $F_{Maj}$   $D^7$   $G^7$   $C_{Maj}$ :

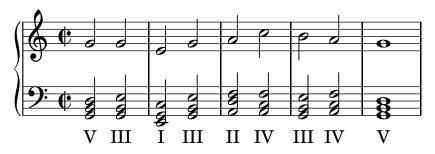

# Application: harmonic similarity

- ► A practical application of a harmony model is to estimate harmonic similarity between songs
- ▶ The more similar the trees, the more similar the harmony
- ▶ We don't want to write a diff algorithm for our complicated model; we get it automatically by using a generic diff
- ► The generic diff is a type-safe tree-diff algorithm, part of a student's MSc work at Utrecht University
- ► Generic, thus working for any model, and independent of changes to the model

## Application: automatic harmonisation of melodies

Another practical application of a harmony model is to help selecting good harmonisations (chord sequences) for a given melody:

We generate candidate chord sequences, parse them with the harmony model, and select the one with the least errors.

### Application: chord recognition

Yet another practical application of a harmony model is to improve chord recognition from audio sources.

		0.92 C	0.96 Em
Chord candidates		0.94 Gm	0.97 C
	1.00 C	1.00 G	1.00 Em
Beat number	1	2	3

How to pick the right chord from the chord candidate list? Ask the harmony model which one fits best.

Demo: Chordify

### Chordify: architecture

#### Frontend

- Reads user input, such as YouTube/Soundcloud/Deezer links, or files
- Extracts audio
- Calls the backend to obtain the chords for the audio
- Displays the result to the user
- Implements a queueing system, and library functionality
- Uses PHP, JavaScript, MongoDB

## Chordify: architecture

#### Frontend

- ▶ Reads user input, such as YouTube/Soundcloud/Deezer links, or files
- ► Extracts audio
- ▶ Calls the backend to obtain the chords for the audio
- Displays the result to the user
- ▶ Implements a queueing system, and library functionality
- ► Uses PHP, JavaScript, MongoDB

#### Backend

- ► Takes an audio file as input, analyses it, extracts the chords
- The chord extraction code uses GADTs, type families, generic programming (see the harmtrace package on Hackage)
- ► Performs PDF and MIDI export (using LilyPond)
- Uses Haskell, SoX, sonic annotator, and is mostly open source

## Chordify: architecture

#### Frontend

- ► Extracts audio
- ► Calls the backend to obtain the chords for the audio
- Displays the result to the user
- ▶ Implements a queueing system, and library functionality
- ► Uses PHP, JavaScript, MongoDB

#### Backend

- ► Takes an audio file as input, analyses it, extracts the chords
- ► The chord extraction code uses GADTs, type families, generic programming (see the harmtrace package on Hackage)
- ► Performs PDF and MIDI export (using LilyPond)
- Uses Haskell, SoX, sonic annotator, and is mostly open source
- Will replace the frontend queuing system (using Happstack)

### Summary

### Musical modelling with Haskell:

- A model for musical harmony as a Haskell datatype
- ► Makes use of several advanced functional programming techniques, such as generic programming, GADTs, and type families
- ▶ When chords do not fit the model: error correction
- ► Harmonising melodies
- Recognising harmony from audio sources

# Play with it!
